## Euler.

Leonhard Euler (1707-1783)

- Successor of Nicolaus Bernoulli in St. Petersburg (1726-1727).
- Member of the newly founded St. Petersburg Academy of Sciences (1727).
- 1741-1766: Director of Mathematics, later inofficial head of the Berlin Academy.

## Euler diagrams.

## Lettres à une Princesse d'Allemagne (1768-72).

"Every $A$ is $B$."
"No $A$ is $B$."
"Some (but only some) $A$ is B."
"Some (but only some) $A$ is not $B$."
(Diagrams with Existential import!)

## Gergonne (1).

Joseph Diaz Gergonne (1771-1859).

- Very active in the wars after the French revolution.
- Discoverer of the duality principle in geometry.
- Essais de dialectique rationnelle (1816-1817):

AhB

AIB

## Gergonne (2).

## Gergonne (3).

Syllogisms of the first figure: $A \bullet_{0} B, B \bullet_{1} C: A \bullet_{2} C$.

|  | h | x | l | c | 0 |
| :---: | :---: | :---: | :--- | :---: | :---: |
| h |  | $\neg \mathrm{l}, \neg 0$ | h | $\neg \mathrm{l}, \neg 0$ | h |

| l | h | x | l | c | 0 |
| c | h | $\neg \mathrm{l}, \neg 0$ | c | c |  |
| 0 | $\neg \mathrm{l}, \neg \mathrm{c}$ | $\neg \mathrm{h}, \neg \mathrm{l}, \neg \mathrm{c}$ | o | $\neg \mathrm{h}$ | 0 |

If $A x B$ and $B c C$, then $\neg A I C$ and $\neg A \supset C$.

## De Morgan.

Augustus de Morgan (1806-1871).

- Professor of Mathematics at UCL (1828).
- Corresponded with Charles Babbage (1791-1871) and William Rowan Hamilton (1805-1865).
- 1866. First president of the London Mathematical Society.
- $x=43, x^{2}=1849 . y=45, y^{2}=2025$.

De Morgan rules. $\quad \neg(\Phi \wedge \Psi) \equiv \neg \Phi \vee \neg \Psi$

$$
\neg(\Phi \vee \Psi) \equiv \neg \Phi \wedge \neg \Psi
$$

## Boole (1).

## George Boole (1815-1864).

- School teacher in Doncaster, Liverpool, Waddington (1831-1849).
- Correspondence with de Morgan.
- Professor of Mathematics at Cork (1849).
- Developed an algebra of logic based on the idea of taking the extensions of predicates as objects of the algebra.
- 1 is the "universe of discourse", 0 is the empty extension.

## Boole (2).

"All $B$ are $A$ "
"No $B$ is an $A$ "
$b(\mathbf{1}-a)=\mathbf{0}$.
$b a=0$.
"Some $B$ is an $A$ "
$b a \neq 0$.
"Some $B$ is not an $A$ " $\quad b(1-a) \neq 0$.

## Celarent.

- We assume: $b a=\mathbf{0}$ and $c(\mathbf{1}-b)=\mathbf{0}$.
- We have to show: $c a=0$.
- $b a=\mathbf{0}$ implies that $c b a=c \mathbf{0}=\mathbf{0}$.
- $c a=c a-\mathbf{0}=c a-c b a=a(c-b c)=a(c(\mathbf{1}-b))=a c \mathbf{0}=\mathbf{0}$.

## Venn.

John Venn (1834-1923).

- Lecturer in Moral Science at Cambridge (1862).
- Area of interest: logic and probability theory.
- Symbolic Logic (1881).
- The Principles of Empirical Logic (1889).
- Alumni Cantabrigienses.

## Venn diagrams.

## Boolean Algebras (1).

## A structure $\mathbf{B}=\langle B, 0,1,+, \cdot,-\rangle$ is a Boolean algebra if

- $B$ is a set with $0,1 \in B$.
-     + and • are binary operations on $B$ satisfying the commutative and associative laws.
-     - is a unary operation on $B$.
-     + distributes over and vice versa: $x+(y \cdot z)=(x+y) \cdot(x+z)$ and $x \cdot(y+z)=(x \cdot y)+(x \cdot z)$.
- $x \cdot x=x+x=x$ (idempotence), $--x=x$.
- $-(x \cdot y)=(-x)+(-y),-(x+y)=(-x) \cdot(-y)$ (de Morgan's laws).
- $x \cdot(-x)=0, x+(-x)=1, x \cdot 1=x, x+0=x, x \cdot 0=0, x+1=1$.
- $-1=0,-0=1$.

Example. $\left.B=\{0,1\} .$\begin{tabular}{c|cc}
$\cdot$ \& 0 \& 1 <br>
\hline 0 \& 0 \& 0

 

+ \& 0 \& 1 <br>
\hline 1 \& 0 \& 1
\end{tabular} \(\begin{aligned} \& 1 <br>

\& 0\end{aligned} \right\rvert\,\)| 1 |
| :--- |

## Boolean Algebras (2).

$X:=\{$ Platon, Aristotle, Speusippus, Themistokles $\}$
Phil := \{Platon, Aristotle, Speusippus\}
Rhet := \{Themistokles\}
Acad := \{Platon, Speusippus\}
Peri $:=\{$ Aristotle $\}$
$B:=\{\varnothing, X$, Phil, Rhet, Acad, Peri, Rhet + Peri, Rhet + Acad $\}$.

## Boolean Algebras (3).

If $X$ is a set, let $\wp(X)$ be the power set of $X$, i.e., the set of all subsets of $X$.
For $A, B \in \wp(X)$, we can define

- $A \cdot B:=A \cap B$,
- $A+B:=A \cup B$,
- $0:=\varnothing$,
- $1:=X$,
- $-A:=X \backslash A$.

Then $\langle\wp(X), 0,1,+, \cdot,-\rangle$ is a Boolean algebra, denoted by $\operatorname{Pow}(X)$.

## Boolean Algebras (4).

Define the notion of isomorphism of Boolean algebras: Let $\mathbf{B}=\langle B, 0,1,+, \cdot,-\rangle$ and $\mathbf{C}=\langle C, \perp, \top, \oplus, \otimes, \ominus\rangle$ be Boolean algebras. A function $f: B \rightarrow C$ is a Boolean isomorphism if

- $f$ is a bijection,
- for all $x, y \in B$, we have $f(x+y)=f(x) \oplus f(y)$,

$$
\begin{aligned}
& f(x \cdot y)=f(x) \otimes f(y), f(-x)=\ominus f(x), f(0)=\perp, \\
& f(1)=\mathrm{T} .
\end{aligned}
$$

Stone Representation Theorem. If B is a Boolean algebra, then there is some set $X$ such that $\mathbf{B}$ is isomorphic to a subalgebra of $\operatorname{Pow}(X)$.

## Circuits.

e + corresponds to having two switches in parallel: if either (or both) of the switches are ON, then the current can flow.

- . corresponds to having two switches in series: if either (or both) of the switches are OFF, then the current is blocked.

## The Delic problem (1).

If a cube has height, width and depth 1 , then its volume is $1 \times 1 \times 1=1^{3}=1$.
If a cube has height, width and depth 2 , then its volume is $2 \times 2 \times 2=2^{3}=8$.
In order to have volume 2, the height, width and depth of the cube must be $\sqrt[3]{2}$ :

$$
\sqrt[3]{2} \times \sqrt[3]{2} \times \sqrt[3]{2}=(\sqrt[3]{2})^{3}=2
$$

## The Delic problem (2).

Question. Given a compass and a ruler that has only integer values on it, can you give a geometric construction of $\sqrt[3]{2}$ ?
Example. If $x$ is a number that is constructible with ruler and compass, then $\sqrt{x}$ is constructible.

Proof.
If $x$ is the sum of two squares (i.e., $x=n^{2}+m^{2}$ ), then this is easy by Pythagoras. In general:

## The Delic problem (3).

It is easy to see what a positive solution to the Delic problem would be. But a negative solution would require reasoning about all possible geometric constructions.

## Geometries (1).

- We call a structure $\langle P, L, I\rangle$ a plane geometry if $I \subseteq P \times L$ is a relation.
- We call the elements of $P$ "points", the elements of $L$ "lines" and we read $p I \ell$ as " $p$ lies on $\ell$ ".
- If $\ell$ and $\ell^{*}$ are lines, we say that $\ell$ and $\ell^{*}$ are parallel if there is no point $p$ such that $p I \ell$ and $p I \ell^{*}$.
- Example. If $P=\mathbb{R}^{2}$, then we call $\ell \subseteq P$ a line if

$$
\ell=\{\langle x, y\rangle ; y=a \cdot x+b\}
$$

for some $a, b \in \mathbb{R}$. Let $\mathcal{L}$ be the set of lines. We write pIl if $p \in \ell$. Then $\langle P, \mathcal{L}, I\rangle$ is a plane geometry.

## Geometries (2).

- (A1) For every $p \neq q \in P$ there is exactly one $\ell \in L$ such that $p I \ell$ and $q I \ell$.
- (A2) For every $\ell \neq \ell^{*} \in L$, either $\ell$ and $\ell^{*}$ are parallel, or there is exactly one $p \in P$ such that $p I \ell$ and $p I \ell^{*}$.
- ( N ) For every $p \in P$ there is an $\ell \in L$ such that $p$ doesn't lie on $\ell$ and for every $\ell \in L$ there is an $p \in P$ such that $p$ doesn't lie on $\ell$.
- (P2) For every $\ell \neq \ell^{*} \in L$, there is exactly one $p \in P$ such that $p I \ell$ and $p I \ell^{*}$.

A plane geometry that satisfies (A1), (A2) and ( N ) is called a plane. A plane geometry that satisfies (A1), (P2) and (N) is called a projective plane.

## Geometries (3).

-(A1) For every $p \neq q \in P$ there is exactly one $\ell \in L$ such that $p I \ell$ and $q I \ell$.
-(A2) For every $\ell \neq \ell^{*} \in L$, either $\ell$ and $\ell^{*}$ are parallel, or there is exactly one $p \in P$ such that $p I \ell$ and $p I \ell^{*}$.
-(N) For every $p \in P$ there is an $\ell \in L$ such that $p$ doesn't lie on $\ell$ and for every $\ell \in L$ there is an $p \in P$ such that $p$ doesn't lie on $\ell$.
Let $\mathbf{P}:=\left\langle\mathbb{R}^{2}, \mathcal{L}, \in\right\rangle$. Then $\mathbf{P}$ is a plane.

- (WE) ("the weak Euclidean postulate") For every $\ell \in L$ and every $p \in P$ such that $p$ doesn't lie on $\ell$, there is an $\ell^{*} \in L$ such that $p I \ell^{*}$ and $\ell$ and $\ell^{*}$ are parallel.
- (SE) ("the strong Euclidean postulate") For every $\ell \in L$ and every $p \in P$ such that $p$ doesn't lie on $\ell$, there is exactly one $\ell^{*} \in L$ such that $p I \ell^{*}$ and $\ell$ and $\ell^{*}$ are parallel.
$\mathbf{P}$ is a strongly Euclidean plane.

## Geometries (4).

Question. Do (A1), (A2), (N), and (WE) imply (SE)?
It is easy to see what a positive solution would be, but a negative solution would require reasoning over all possible proofs.

Semantic version of the question. Is every weakly Euclidean plane strongly Euclidean?

## Syntactic versus semantic.

|  | Does $\Phi$ imply $\psi \boldsymbol{?}$ | Does every $\Phi$-structure satisfy $\psi \boldsymbol{?}$ |
| :---: | :---: | :---: |
| Positive | Give a proof | Check all structures |
|  | $\exists$ | $\forall$ |
| Negative | Check all proofs | Give a counterexample |
|  | $\forall$ | $\exists$ |

## A non-Euclidean geometry.

Take the usual geometry $\mathbf{P}=\left\langle\mathbb{R}^{2}, \mathcal{L}, \in\right\rangle$ on the Euclidean plane.
Consider $\mathbb{U}:=\left\{x \in \mathbb{R}^{2} ;\|x\|<1\right\}$. We define the restriction of $\mathcal{L}$ to $\mathbb{U}$ by $\mathcal{L}^{\mathbb{U}}:=\{\ell \cap \mathbb{U} ; \ell \in \mathcal{L}\}$.
$\mathbf{U}:=\left\langle\mathbb{U}, \mathcal{L}^{\mathbb{U}}, \in\right\rangle$.
Theorem. U is a weakly Euclidean plane which is not strongly Euclidean.
