Test exam
Solutions to exercises

Introduction to Logic
Minor Logic and Computation

July 26, 2021

Exercise 1 (10 points). Argue by making use of a truth table whether the
following argument is valid or not. If it is not valid specify a counter-example.

\[(p \land q) \rightarrow r, \neg q \lor r, p/\neg q\]

Solution.

<p>| | | | | | | |</p>

</tbody>
</table>

This argument is not valid. In order for an argument to be valid, it must be the
case that in all cases where the premises are true, the conclusion is true as well.

A counter-example is given in the first row: \(V(p) = V(q) = V(r) = 1\).

Exercise 2 (10 points). Prove that \(\varphi \rightarrow \neg \psi\) is a contradiction iff \(\varphi\) and \(\psi\) are both tautologies.

Solution. We need to prove a bi-conditional statement and therefore we need to
prove both directions.

\[\Rightarrow\] Assume that \(\varphi \rightarrow \neg \psi\) is a contradiction. This means that for all valuations
\(V\) the valuation of the formula is false. A conditional can only be false
if the antecedent is true and the consequent is false. This means that for
all valuations \(V\) the antecedent of the conditional is one, \(V(\varphi) = 1\), and
the consequent of the conditional is false, \( V(\neg \psi) \). Since \( \varphi \) is true for all valuations it follows by definition that \( \varphi \) is a tautology. Since \( \neg \psi \) is false for all valuations it must be the case that \( \psi \) is true for all valuations. It follows by definition that \( \psi \) is a tautology.

\[ \leftarrow \]

Assume that \( \varphi \) and \( \psi \) are tautologies. This means that for all valuations \( V \colon V(\varphi) = V(\psi) = 1 \). From this it follows that for all valuations \( V \) \( V(\neg \psi) = 0 \). Since for all valuations \( V \) we have that \( \varphi \) is true and \( \neg \psi \) is false, we may conclude by the truth-table of the implication that for all valuations \( V \) the implication \( \varphi \to \neg \psi \) is false. By definition, this means that \( \varphi \to \neg \psi \) is a contradiction.

**Exercise 3** (5 points). Translate the following sentences in the language of first-order predicate logic. Use the identity sign if necessary.

(1) All students who passed the exam are pleased with themselves.

(2) All students made at least two exams this semester.

(3) There is one exam that only John passed.

*Solution.* Other translations could be correct also.

Translation key: \( Sx := x \) is a student, \( j := \) John, \( P_{1xy} := x \) passes \( y \), \( P_{2xy} := x \) is pleased with \( y \), \( Ex := x \) is an exam, \( Mxy := x \) made \( y \).

(4) \( \forall x ((Sx \land P_{1xe}) \to P_{2xx}) \)

(5) \( \forall x (Sx \to \exists y \exists z (y \neq z \land Ey \land Ez \land Mxy \land Mxz)) \)

(6) \( \exists x (Ex \land \forall y ((Ey \land P_{1jy} \leftrightarrow x = y)) \)

**Exercise 4** (25 points). Consider the model \( M = \langle D, R, I \rangle \), where

\[
D = \{1, 2, 3, 4\}
\]

\[
I(R) = \{(1, 2), (1, 3), (1, 4), (2, 3), (2, 4), (3, 4)\}
\]

\[
I(a) = 1; I(b) = 2; I(c) = 3; I(d) = 4
\]

Argue whether the following sentences are true in this model or not.

1. \( \forall y (\exists x Rxy \leftrightarrow \exists z Ryz) \)

2. \( \forall x \forall y \forall z ((Rxy \land Ryz) \to Rxz) \)

3. \( \forall x \forall y (x = y \leftrightarrow (Rxy \leftrightarrow Ryx)) \)

*Solution.*
1. $\mathcal{M} \notmodels \forall y (\exists x Rxy \leftrightarrow \exists z Ryz)$. This formula means that every point has an arrow pointing towards it iff it has a arrow pointing away from it. Object 1 in the domain is a case for which this does not hold. It has arrows leaving this point but none coming in. The statement is therefore false in this model.

2. $\mathcal{M} \models \forall x \forall y \forall z ((Rxy \land Ryz) \rightarrow Rxz)$. This formula means that whenever there is an arrow from one point to a second and from the second to a third, there is an arrow point from the first to the third point. A property called transitivity and it holds in this model. This formulas is true in this model.

3. $\mathcal{M} \notmodels \forall x \forall y (x = y \leftrightarrow (Rxy \leftrightarrow Ryx))$. Reflexive points and no arrows going back and forth between to different points. False in this model.

Exercise 5 (20 points). One of the following arguments is valid, the other is invalid.

$\forall x (Ax \lor Bx), \forall x (Ax \rightarrow Cx), \exists x \neg Cx / \exists x Bx$

$\forall x \exists y \exists z (x \neq y \land x \neq z \land y \neq z \land Rxy \land Rxz) / \forall x \forall y (x \neq y \rightarrow (Rxy \lor Ryx))$

If the argument is not valid, argue this fact by using a counter-model. If the argument is valid, give a proof.

Solution.

1. We think the first sentence is true, so let’s try to prove this. Assume $\mathcal{M}$ is a model in which the premises are true. This means that $\exists x \neg Cx$ is true and therefore there must be an element, let’s call it $o$, in the domain that is not $C$.

On the basis of the first premise $o$ is $A$ or $B$.

Assume $o$ is $A$. In that case on the basis of the second premise $o$ is $C$. But $o$ is not $C$. Contradiction. So $o$ must be $B$.

This means there is an element in the domain that is $B$ and the conclusion is true.
2. This argument is invalid. The first sentence says that for every point arrows go out to two different points. The conclusion says that between every pair of points an arrow goes between them. We present a counterexample.

![Diagram](image)

Clearly, the first sentence is true in this model, for every point, arrows go out to two other points. But the conclusion is false. For instance there are no arrows between 1 and 4.

**Exercise 6** (10 points). Show by means of a natural deduction that the following assertions are correct:

1. \( (p \lor (q \land r)) \vdash (p \lor r) \)

   1. \( (p \lor (q \land r)) \)  
      - Premise
   2. \( p \)  
      - Assumption
   3. \( p \lor r \)  
      - \( \lor \), 2
   4. \( p \rightarrow (p \lor r) \)  
      - \( \rightarrow \), 2, 3
   5. \( q \land r \)  
      - Assumption
   6. \( r \)  
      - \( \land \), 5
   7. \( p \lor r \)  
      - \( \lor \), 6
   8. \( (q \land r) \rightarrow (p \lor r) \)  
      - \( \rightarrow \), 5, 7
   9. \( (p \lor r) \)  
      - \( \lor \), 8, 4, 1

2. \( \vdash (p \lor \neg p) \)
1. \( \neg(p \lor \neg p) \)  
   Assumption

2. \( p \)  
   Assumption

3. \( p \lor \neg p \)  
   \( \lor \), 2

4. \( \bot \)  
   \( \bot \), 3, 1

5. \( \neg p \)  
   \( \neg \),

6. \( p \lor \neg p \)  
   \( \lor \), 5

7. \( \bot \)  
   \( \bot \), 6, 1

8. \( \neg(p \lor \neg p) \)  
   \( \neg \), 8

9. \( (p \lor \neg p) \)  
   \( \neg \),

3. \( \neg \exists x(Fx \land Gx) \vdash \forall x(Fx \rightarrow \neg Gx) \)

1. \( \neg \exists x(Fx \land Gx) \)  
   Premise

2. \( Fa \)  
   Assumption

3. \( Ga \)  
   Assumption

4. \( Fa \land Ga \)  
   \( \land \), 3, 2

5. \( \exists x(Fx \land Gx) \)  
   \( \exists \), 4

6. \( \bot \)  
   \( \bot \), 5, 1

7. \( \neg Ga \)  
   \( \neg \), 6

8. \( Fa \rightarrow \neg Ga \)  
   \( \rightarrow \), 7, 2

9. \( \forall x(Fx \rightarrow \neg Gx) \)  
   \( \forall \), 8

4. \( \exists xAx \rightarrow \forall xBx, \exists x\neg Bx \vdash \neg \exists xAx \)

1. \( \exists xAx \rightarrow \forall xBx \)  
   Premise

2. \( \exists x\neg Bx \)  
   Premise

3. \( \exists xAx \)  
   Assumption

4. \( \forall xBx \)  
   \( \forall \), 3, 1

5. \( \neg Ba \)  
   Assumption

6. \( Ba \)  
   \( \neg \), 4

7. \( \bot \)  
   \( \bot \), 6, 5

8. \( \neg Ba \rightarrow \bot \)  
   \( \rightarrow \), 7, 2

9. \( \bot \)  
   \( \bot \), 8, 2

10. \( \neg \exists Ax \)  
    \( \bot \), 9
5. $(\exists x Rax \land \forall x Rxa) \rightarrow \forall x Rax, \forall x Rxa \vdash Rab$

**Exercise 7** (20 points). Consider the following properties of relations.

- Transitivity (TR),
- Antisymmetry (AS),
- Irreflexivity (IR).

Exactly one of these properties follows logically from the other two combined. This means that if a relation has two of these properties, it has the third one as well.

Which of the following properties follows from the other two?

Argue your answer.

**Solution.** We argue that if a relation is transitive and symmetric, then it must be antisymmetric.

Suppose a relation $R$ is transitive and irreflexive. Assume that we have $Rxy$ and $Ryx$. By transitivity this means that $Rxx$ which is impossible give irreflexivity. So we can never have $Rxy$ and $Ryx$.
